

AWS Elastic Beanstalk Deployment Documentation

This document explains the deployment of a Node.js application using AWS Elastic Beanstalk. The screenshot shows an environment being launched successfully. Elastic Beanstalk automates infrastructure provisioning, EC2 instance creation, security groups, Elastic IP allocation, application deployment, monitoring, logging, and scaling.

Objectives:

- Deploy a Node.js application.
- Monitor deployment events.
- Verify environment health.
- Understand AWS managed resources.

Deployment Steps:

1. Create an Elastic Beanstalk application.
2. Select Node.js platform.
3. Upload application source bundle.
4. Launch the environment.
5. Monitor Events until health becomes Green.
6. Test the application URL.

Key AWS Services:

Elastic Beanstalk, EC2, IAM, S3, CloudWatch, SNS, Security Groups, Elastic IP.

Benefits:

- Automatic deployment
- Easy scaling
- Built-in monitoring
- Faster development
- Simplified infrastructure management

Conclusion:

AWS Elastic Beanstalk is an effective Platform as a Service (PaaS) offering that enables developers

to deploy and manage web applications with minimal operational effort while AWS handles much of the underlying infrastructure.
